Research Interests

In order to bridge the gaps between observation, theory, and prediction, modern science relies heavily on sophisticated computational methods. From simulating star formation to proton transport, from climate change and sea level rise to turbulence and combustion, and from optimized structural design to the development of personalized treatment pathways in state-of-the-art medical practice, complex computer simulations are indispensable, regardless of scale. By studying the mathematics behind computer simulations, I try to bring clarity and insight to otherwise intractable problems like these.

I am currently interested in applying my work to problems at the frontiers of science and engineering research by expanding on state-of-the-art techniques in optimal control, uncertainty quantification, and high performance computing.
